
Scenario-Based Learning

A company works with number of employees, all the works are dependents on the employees. Even if one of the employees resign the job immediately then assigned work will be not finished at the time, so delivery of the project to the clients will be delayed. Company planned to make solution for this, they want to know which employee may resign next. If they know previously, they can arrange alternative to avoid such problem. As an AI Engineer you must give Solution to this.

A) HOW WILL YOU ACHIEVE THIS IN AI?

We can achieve this by creating a predictive model by recognizing the factors that influence an employee's decision to leave

B) FIND OUT THE 3 -STAGE OF PROBLEM IDENTIFICATION

- Stage 1:** Collecting and analysing the clients data -> i.e. Employee record from HR -> Text Data, hence the domain selection here is NLP.
- Stage 2:** From the data, predict the learning method -> after going the data set, it has clear input and output, we build a Supervised learning model
- Stage 3:** Learning which method to analyse -> Since the attrition is categorical data, Classification can be used to predict the attrition

C) NAME THE PROJECT

Employee attrition

D) CREATE THE DUMMY DATASET.

Employee ID	Age	Gender	Marital Status	Department	Job Role	Monthly Income	Performance Rating	Job Satisfaction	Environment Satisfaction	Work Life Balance	Years At Company	Number of Companies Worked	Years Since Last Promotion	Distance From Home	Overtime	Hire Date	Attrition Date	Attrition	Attrition Label
